

Practical aspects of deep learning

Quiz, 10 questions

10/10 points (100.00%)

✓

Congratulations! You passed!

Next item

✓

1 / 1 point

1.

If you have 10,000,000 examples, how would you split the train/dev/test set?

98% train . 1% dev . 1% test

Correct

60% train . 20% dev . 20% test

33% train . 33% dev . 33% test

✓

1 / 1 point

2.

The dev and test set should:

Come from the same distribution

Correct

Come from different distributions

Be identical to each other (same (x,y) pairs)

Have the same number of examples

✓

1 / 1 point

3.

If your Neural Network model seems to have high variance, what of the following would be promising things to try?

Get more test data

Un-selected is correct

Add regularization

Correct

Make the Neural Network deeper

Un-selected is correct

Increase the number of units in each hidden layer

Un-selected is correct

Get more training data

Correct

✓

1 / 1 point

4.

You are working on an automated check-out kiosk for a supermarket, and are building a classifier for apples, bananas and oranges. Suppose your classifier obtains a training set error of 0.5%, and a dev set error of 7%. Which of the following are promising things to try to improve your classifier? (Check all that apply.)

Increase the regularization parameter lambda

Correct

Decrease the regularization parameter lambda

Un-selected is correct

Get more training data

Correct

Use a bigger neural network

Un-selected is correct

✓

1 / 1 point

5.

What is weight decay?

A technique to avoid vanishing gradient by imposing a ceiling on the values of the weights.

Gradual corruption of the weights in the neural network if it is trained on noisy data.

A regularization technique (such as L2 regularization) that results in gradient descent shrinking the weights on every iteration.

Correct

The process of gradually decreasing the learning rate during training.

✓

1 / 1 point

6.

What happens when you increase the regularization hyperparameter lambda?

Weights are pushed toward becoming smaller (closer to 0)

Correct

Weights are pushed toward becoming bigger (further from 0)

Doubling lambda should roughly result in doubling the weights

Gradient descent taking bigger steps with each iteration (proportional to lambda)

✓

1 / 1 point

7.

With the inverted dropout technique, at test time:

You apply dropout (randomly eliminating units) and do not keep the 1/keep_prob factor in the calculations used in training

You do not apply dropout (do not randomly eliminate units) and do not keep the 1/keep_prob factor in the calculations used in training

Correct

You apply dropout (randomly eliminating units) but keep the 1/keep_prob factor in the calculations used in training.

You do not apply dropout (do not randomly eliminate units), but keep the 1/keep_prob factor in the calculations used in training.

✓

1 / 1 point

8.

Increasing the parameter keep_prob from (say) 0.5 to 0.6 will likely cause the following: (Check the two that apply)

Increasing the regularization effect

Un-selected is correct

Reducing the regularization effect

Correct

Causing the neural network to end up with a higher training set error

Un-selected is correct

Causing the neural network to end up with a lower training set error

Correct

✓

1 / 1 point

9.

Which of these techniques are useful for reducing variance (reducing overfitting)? (Check all that apply.)

Xavier initialization

Un-selected is correct

Dropout

Correct

Data augmentation

Correct

Vanishing gradient

Un-selected is correct

L2 regularization

Correct

Exploding gradient

Un-selected is correct

Gradient Checking

Un-selected is correct

✓

1 / 1 point

10.

Why do we normalize the inputs x?

Normalization is another word for regularization--It helps to reduce variance

It makes the parameter initialization faster

It makes the cost function faster to optimize

Correct

It makes it easier to visualize the data
